## Soil Related Benefits of Controlled Traffic

Dick Godwin

## Outline

National costs of compaction

Sources of damage

Effects of compaction on:-

Tillage forces/power

Infiltration

Runoff

Greenhouse gases

Yield

Benefits of CTF

Concluding comments

# Soil Related Benefits of Controlled Traffic

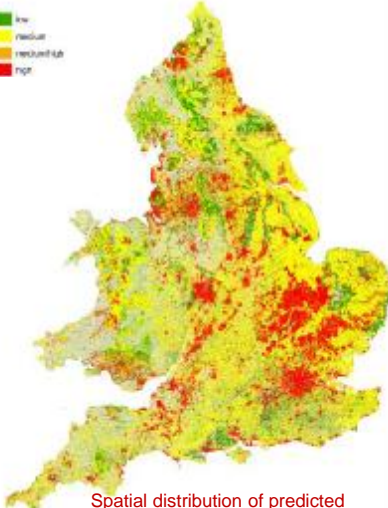

## Cost of soil degradation in England and Wales

  
 Harper Adams University

The assessment explored the total costs of soil degradation:

- The total quantified costs of soil degradation are estimated at between **£0.9 bn and £1.2 bn** per year.
- **Compaction** and loss of soil organic content account for **39%** and **45%** respectively of annual costs.
- Silts and sands account 67% of total estimated erosion costs, and **clays and sands for 91% of compaction costs.**
- Almost 80% of total quantified costs occur offsite.
- In terms of soilscape, arable farming accounts for over 70% of erosion and compaction related costs.

Spatial distribution of predicted probability of compaction

## Environmental benefits of CTF

Harper Adams University

Randomly trafficked

CTF

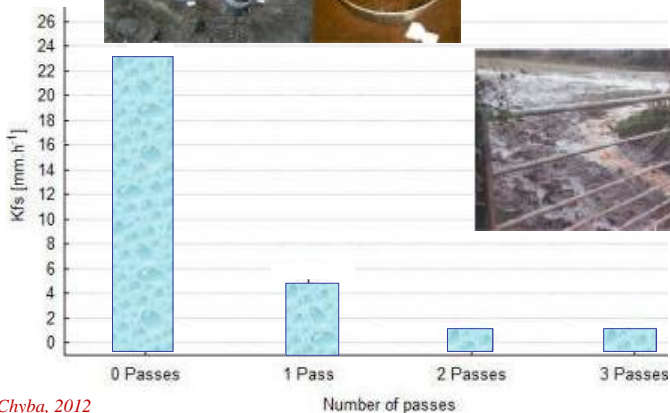

- 4 x increase in infiltration
- less run-off and erosion
- reduced pollution of water courses
- more plant available water

## Infiltration

Harper Adams University

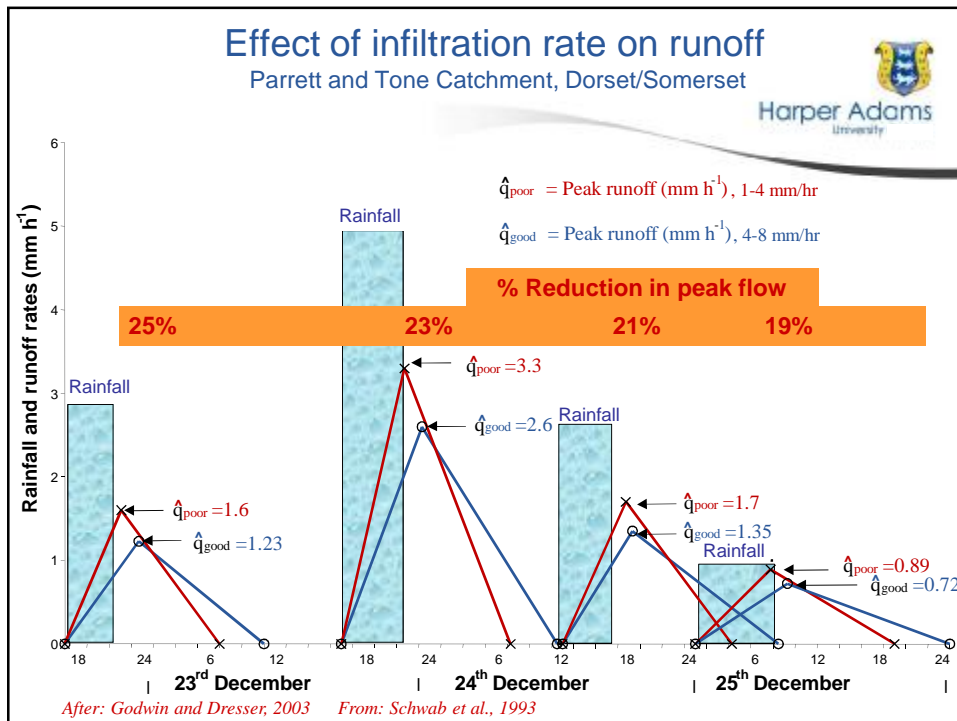

Relationship between four different compaction levels and water infiltration rate

## Estimating greenhouse gas emissions in controlled traffic farming systems in Australia

Eugene K. Antille<sup>1\*</sup>, J. A. Tallon<sup>2</sup>, A. Barber<sup>3</sup>, L. Blain<sup>4</sup>, L. Tolosa<sup>5</sup>, J. Schmidt<sup>6</sup>

<sup>1</sup>University of Southern Queensland, Australia; <sup>2</sup>University of Queensland, Australia; <sup>3</sup>University of Queensland, Australia; <sup>4</sup>University of Queensland, Australia; <sup>5</sup>University of Queensland, Australia; <sup>6</sup>University of Queensland, Australia

### 1. Background

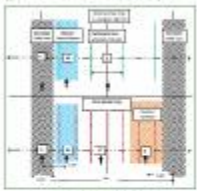

- Controlled traffic farming (CTF) involves all field-bearing wheels on permanent traffic lanes only (Fig. 1).
- Traffic systems in CTF systems cover approximately 10% of the field, compared with 40% to 80% under non-CTF systems (2, 3).
- Soil compaction reduces water infiltration, increases frequency and duration of soil crusting, increases soil erosion (4) and reduces soil fertility (5).

### 2. Aim

- To quantify the effect of fully controlling field traffic on greenhouse gas (GHG) emissions from grain cropping systems.
- The project also seeks to demonstrate that GHG emissions can be significantly reduced in CTF systems due to reduction in soil erosion and water logging, compared with non-CTF systems.

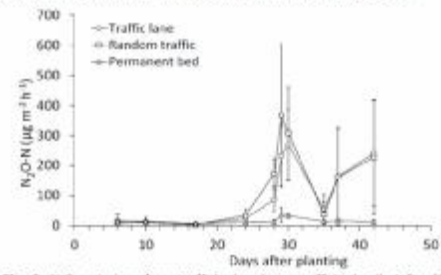

### 3. Materials and Methods

- Experiment sites are located in Queensland, Victoria and Western Australia, and represent intensive grain production under permanent CTF systems.
- Gas flux emissions (CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O) are measured from CTF plots which have additional 'random' traffic to simulate wheel-traction impacts in non-CTF systems (Fig. 2).
- Three treatments are given: (i) Treatment traffic lanes, (ii) Random wheeling and (iii) Permanent crop belt in CTF field. Strategic fertilizer applied as continuous emission (32% N), applied as discrete (variable) emission.
- Four chambers are installed across an 18 m span, allowing optional control of 20 minutes (variable) from 0 to 60 minutes, and flux rate calculations estimated from the linear increase in gas concentration.

### 4. Discussion and Conclusions

- Post-seeding emissions from CTF can be up to 60% lower than non-CTF systems under zero-tillage (Fig. 3) (4).
- Random crop rotation significantly larger carbon sequestration (100 t/ha) subjected to random traffic at 40 days post-planting, lanes compared with non-irrigated soil (2).
- Influence of N<sub>2</sub>O emissions are due to reduced infiltration rates in trafficked compared with non-trafficked soil (6).
- Emissions from soil subjected to random traffic and from permanent traffic lanes are of similar magnitude (5).

**Fig. 3: N<sub>2</sub>O emissions from trafficked and non-trafficked soils (after [5]).**

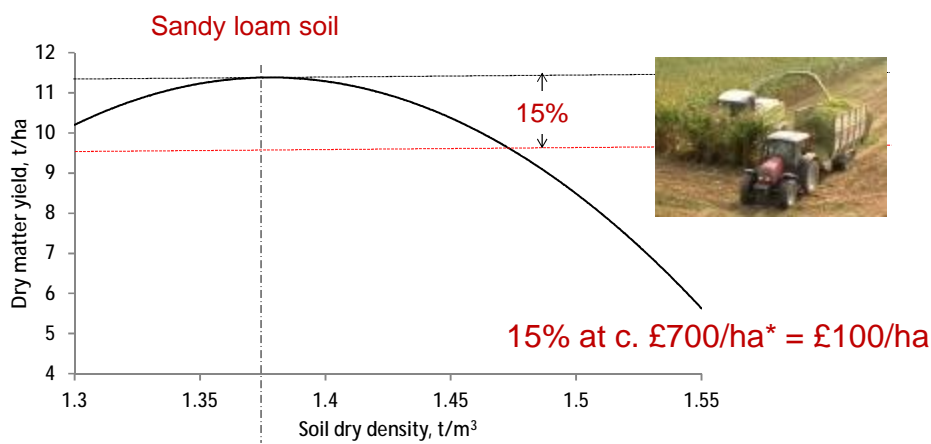

- Post-seeding emissions from CTF can be up to 60% lower than non-CTF systems under zero-tillage (Fig.3) [4],
- Rainfall can initiate significantly larger spikes in N<sub>2</sub>O emissions from soil subjected to random traffic or in permanent traffic lanes compared with non-trafficked soil [5],
- Differences in N<sub>2</sub>O emissions are due to reduced infiltration rates in trafficked compared with non-trafficked soil [6],
- Emissions from soil subjected to random traffic and from permanent traffic lanes are of similar magnitude [5].

**Benefits of Controlled traffic - Field Scale:  
Nitra, Slovakia**

**10% Yield improvement in 2012**

Harper Adams University

April 2011

July 2012

Compacted strips:  
Mean yield = 4.91t/ha

Controlled traffic: Mean yield = 5.39 t/ha

*After: Galambosova and Rataj, 2012*

**Controlled Traffic Farming (CTF)**

Harper Adams University

- Area exposed to wheels < 30-40% & could be <20%
- Improved soil structure
- Reduced input costs: time; fuel; machinery - Down 22%
- Operating profit up 8% (£75/ha without yield addition)
- Increased crop yields from non trafficked soils + 9 to16%
- Infiltration increased by circa 400% in UK

<p><b>Pros</b></p> <ul style="list-style-type: none"> <li>+ Simple concept</li> <li>+ GPS steering/guidance</li> </ul>	<p><b>Cons</b></p> <ul style="list-style-type: none"> <li>- Standardise wheel centres</li> <li>- Industry resistance to change in broad acre crops</li> <li>- GPS reliability</li> <li>- Harvester widths</li> </ul>

# Soil Related Benefits of Controlled Traffic

## Traffic effects on soil fauna

### Bad for earthworms:

- from 40 to 2 per m<sup>2</sup> with 5t wheel loads
- earthworms can have beneficial effects on soil-borne diseases less take-all

### No traffic:

“Good for Peter also good for Paul”

- slugs also like better soil structure, therefore - proactive stance and cultural controls

## Effect of Organic Matter

Fig. 1. The pressure required to reduce the air-filled porosity to 10% (v/v) at pF 1.9 as a function of organic matter content (drawn from data presented by Kuipers, 1959).

# Soil Related Benefits of Controlled Traffic

There are many savings

1. little need for subsoiling
2. less power per unit width
3. less "aggressive" cultivators
4. shallower tillage
5. better stale seedbeds
6. smaller tractors
7. maximum potential for "No till"

Without traffic

- Crop yield gains and savings in:
  - fuel
  - time
  - machinery
  - labour
- Improvements in:
  - soil health
  - nutrient and water use efficiency
  - timeliness

# Soil Related Benefits of Controlled Traffic

## Final Reflection

“Man has only a thin layer of soil between him and starvation”.

*Anonymous*

“The nation that destroys its soils, destroys itself”.

*F. D. Roosevelt*

“There can be no doubt that a society rooted in the soil is more stable than one rooted in pavements”

*Aldo Leopold*

“To forget our soil is to forget ourselves”

*Ghandi*
